

Last Class

- Measures of variation

1 ↳ Interpreting standard deviation.

- Overview of graphs

↳ Line

↳ Pie

↳ Histogram

↳ Bar/Column

Today: More graphs, examples, + sampling

- Bar/Column Graph

Column

- Categorical

- Height

- Ex: Column chart of
number of males & females.

Histogram

In Excel, Histograms are an optional add-in.

Ex: Histogram of age.

If data is randomly missing, then ignore the observation.

Standard deviations greater than 2 are "significant"

Column/Bar ✓
Histogram ✓
Pie Chart

Ex: Pie chart of student
majors

Line Chart

Ex: Land-Ocean Temperature from 1880 to 2010.

(Anomalies in temperature from the "average" temp.)

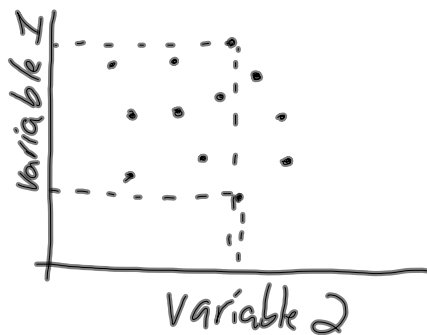

→ Each number is the difference of the year's avg. temp from the average between 1951-1980.

e.g. -0.576 in 1880 means 0.576°F below the '51-'80 avg.

Scatterplot

- Previously we've looked at plotting one variable (uni variate analysis)
one variable
 - We can also explore two variables at the same time. → bivariate (or more) multivariate
- Scatterplots
- ↓
- hard to graph.

Best: When comparing two continuous variables.
↳ Can be used w/ categorical data, but more difficult.

Ex. New data: Educational Spending

- Create scatterplot of "Pay" & spend
- Import data
Web → Excel
- Graph

Three notes:

- ↳ HW #2 to be returned Tuesday.
- ↳ HW #3 posted tomorrow (due Thursday)
- ↳ Tuesday's class will discuss normal distributions (aka. day behind)
